

CHILLYDOG

REFRIGERATION AND AIR CONDITIONING

AT CHILLY DOG WE INVITE YOU TO CONSIDER

OUR COMPLETE SERVICE REGIME:

A service involves cleaning the indoor head unit of the air conditioner as well as the condenser unit located outside. Once this part of the service is complete the system can be checked to see if the pressures are correct and the refrigerant level is sufficient.

Chillydog uses a hydro pressure clean system to service split systems and cassette style air conditioners, this allows the whole indoor head unit, to be washed out, sanitized and disinfected. Our qualified technicians firstly remove the indoor units outer cover and then take photos of the current condition of each indoor unit, then when the service is complete take further photo's, so that even if the client is not on site at the time they can see the amazing difference that our service has made. Which also provides proof of our work commitment of being transparent and providing a professional result.

The drain of the system is also blown clean using high pressure nitrogen that dislodges and removes sludge and build up, prior to slow release drain tablets being applied to the drain pan to help minimise the regrowth of sludge which can cause blocked drains in between services. The indoor unit service completely cleans the barrel fan or scroll, the evaporator coil, filters and all other internal components of the indoor head unit also.

Once complete the technician then cleans the external fascia's of the indoor unit before it is replaced and wiped down with spray and wipe. The outdoor unit or "condenser" is then washed out and refrigerant levels checked, prior to photos being taken of the condition of the system for the clients future reference.
